# "REGULATORY ASPECTS OF BIOLOGICS IN INDIA, USA AND EUROPE"

A PROJECT SUBMITTED TO

## NIRMA UNIVERSITY

In partial fulfillment of the requirements for the degree of

## **Bachelor of Pharmacy**

BY

KAVYA SHAH (16BPH040)

Semester VIII

### UNDER THE GUIDANCE OF

### **DR. BHUMIKA D. PATEL**

## INSTITUTE OF PHARMACY NAAC ACCREDITED 'A' GRADE

INSTITUTE OF PHARMACY NIRMA UNIVERSITY SARKHEJ-GANDHINAGAR HIGHWAY AHMEDABAD-382481 GUJARAT, INDIA

MAY 2020

# **CERTIFICATE**

This is to certify that "REGULATORY ASPECTS OF BIOLOGICS IN INDIA, USA AND EUROPE" is the bonafide work carried out by KAVYA SHAH (16BPH040), B.Pharm semester VIII under our guidance and supervision in the Institute of Pharmacy, Nirma University, Ahmedabad during the academic year 2019-2020. This work is up to my satisfaction.

Guide:

# **CERTIFICATE OF SIMILARITY OF WORK**

This is to undertake that the B.Pharm. Project work entitled "REGULATORY ASPECTS OF BIOLOGICS IN INDIA, USA AND

**EUROPE"** Submitted by **KAVYA SHAH** (16BPH040), B.Pharm. Semester VIII is a bonafide review work carried out by me at the Institute of Pharmacy, Nirma University under the guidance of "Dr. Bhumika D. Patel". I am aware about the rules and regulations of Plagiarism policy of Nirma University, Ahmedabad. According to that, the review/research work carried out by me is not reported anywhere as per best of my Knowledge.

# **Acknowledgement**

Foremost, I would like to express my sincere gratitude to Dr. Bhumika D Patel for her continuous support and guidance throughout my project, for her patience, motivation, enthusiasm and most importantly immense knowledge, which made the process easier and smooth.

I would also like to thank Dr. Manjunath Ghate for offering us an opportunity due to which we were able to carry out this project, which has enriched our knowledge.

I would like to express my sincere thanks to Mr. Manan Shah for helping me in completing this project by giving his valuable and knowledgeable feedback time and again.

Lastly I would like to thank my parents, friends and family for their support.

## **Acknowledgement**

### Acknowledgement

Foremost, I would like to express my sincere gratitude to Dr. Bhumika D Patel for her continuous support and guidance throughout my project, for her patience, motivation, enthusiasm and most importantly immense knowledge, which made the process easier and smooth.

I would also like to thank Dr. Manjunath Ghate for offering us an opportunity due to which we were able to carry out this project, which has enriched our knowledge.

I would like to express my sincere thanks to Mr. Manan Shah for helping me in completing this project by giving his valuable and knowledgeable feedback time and again.

Lastly I would like to thank my parents, friends and family for their support.

#### <u>1. Abstract –</u>

Biologics has been a category in pharmaceuticals for almost a decade now. Increased market need for biologics accounts due to various reasons like big brand name companies losing patent extensions, increased need for biologics as therapeutic interventions in chronic diseases, increased initiatives taken up by governments and rising regulatory convergence and better healthcare facilities for all nations. Hence which also demands for well-defined and structured protocols and procedures for manufacturing, approval and marketing authorization for these, this study will provide an approach for understanding these regulatory aspects of biologics in USA, Europe and India.

#### 2. Introduction -

Biologics are products obtained from living organisms like humans, animals and microorganisms, which may or may not contain a component of it. It finds its application in diagnosis, treatment and prevention of a lot of diseases including various cancers and autoimmune diseases. Biologics mainly include antitoxins, vaccines, proteins, blood, gene therapy, blood components and tissues.(Maurya et al.) These are made up of sugars, nucleic acids or proteins or combinations of these substances. As a matter of fact biologics are an advanced therapy for many diseases like Chron's disease, Ulcerative colitis and Rheumatoid arthritis.

First time biologics were produced by recombinant technique to create replica or enhance complex peptides, proteins and naturally occurring glycoproteins. Today even more complex biologics like monoclonal antibodies have been furnished through use of DNA in cells of bacteria, yeast and mammals to provide assistance to therapeutic intervention. Biologics, biosimilars and generic drugs differ from each other on the basis of their origin, chemical method are usually involved in making of small molecules while biologics are mainly derived from living organisms.

Drug makers in developed and developing countries are more interested in investing in biologics than small molecules as it presents more profitable investment opportunities. The total global budget for 2006 stood at 93 billion dollars and grew by 69 percent to 157 billion dollars in 2011. In 2010 the biological industry was projected at \$254.9 billion, with an growth of 9.5% in CAGR to \$580.5 billion by 2026.

Regulatory factors have developed from the government's intention to safeguard public health by regulation of the protection and efficacy of medication, the veterinary medication, cosmetic goods, medical devices and pesticides; numerous regulatory bodies regulate specific elements of biological goods such as manufacturing, clearance, quality monitoring and authorization to market.

In India CDSCO (central drugs standard control organization), a regulatory body for the assessment of product protection, efficacy and uniformity in the region, is the Main Product Performance Regulation Agency. Genetic Manipulation Review Committee monitors the production and preclinical evaluation of recombinant biologics. A number of biologics are under production in India because of which regulatory agencies are expected to establish an unambiguous regulatory pathway, which specifies the needs of related biologics to an licensed biological comparison to achieve comparable health, effectiveness and efficiency. (CUTS International)

In 2009 a legal outline for authorising biosimilars was established in USA via BPCI act (biologics price competition and innovation act). The BPCI was a amendment to the Act for Public Safety to create an abbreviated for biologics clearance process. The first biosimilars approved in 2015 for the FDA had announced sale in the USA. Since then, FDA has licensed 16 biosimilars and FDA is still planning guidelines on these products and released multiple guidelines on the topic.

In Europe the regulatory body responsible regulation is EMA (European medical agency) in January 2001 EMA started considering scientific issues presented by biosimilars products, In 2003, the European Commission updated the marketing authorization standards for medicinal products and created a related category of biological medicinal products.

#### 3. Market trends-

- Capital expenditures in biologics are rising due to the pressure of chronic illnesses, end of patent rights or exclusivity period of important biologic pharmaceuticals, and growing demand for creative drugs, which are pushing up the global market. (Poojar et al.)
- Investing in biological drugs has allowed large pharmaceutical firms, including Eli Lilly and Company, Bristol-Myers Squibb, Novartis, AstraZeneca, and GlaxoSmithKline (GSK), to capitalize in such drugs, especially in finding cure of major chronic diseases, including cancer and autoimmune diseases. The United States Food and Drug Administration

(FDA) approved three biological products in 2019; one of them is Griffols' anticoagulant treatment. (Ii)

- In the year 2006 the annual global expenditure was \$93 billion and increased by 69% to \$157 billion in 2011.
- In 2015, the global demand for biologics was valued at USD 276.6 billion.
- The demand for biologics was forecast at 254.9 billion dollars in 2017 and with increase of 11.9% CAGR at 625,6 billion by 2026. (Poojar et al.)
- 52.47 51.23 2014 2015 2016 2017 2018 2019 2020 2021 2022 2023 2024 2025 Infectious Diseases Oncology Immunological Disorders Cardiovascular Disorders Haematological Disorders Others Figure 1 – Use of biologics in diseases 2014-2025
- Market share for biologics based on diseases from 2014-2025.

- Due to the decrease in profitability of small drug molecules, biologics are predicted to experience sustainable growth over the next few years. Pharmaceutical firms concentrate on producing multiple biopharmaceutical drugs to retain a spot on the market. (Poojar et al.)
- In Asia Pacific with CAGR, the Biologics demand has risen by 13%, led by 11.8% and 11.6%, respectively, by North America and Europe. The rise in cancer incidence and other target diseases globally is the cornerstone to the growth of the industry in all regions throughout the projected era. (Ii) (Poojar et al.)
- As of 2018, monoclonal antibodies segment dominates the market holding 39% of the global market since it is the primary medicine used for treating cancer. (Ecker et al.)

- Gene biologics expand mainly depending on drug form with a CAGR of 14.3% and followed by vaccines and cell biologics.
- Segment of implementation in the cancer field, autoimmune and infectious diseases industry of 42.2 percent and 35.9 and 14.6 percent respectively.
- Asia Pacific is expected, because of the wide prevalence of target diseases in nations such as India and China, to account for 21.4 percent of the global biological industry. (Poojar et al.)

## <u>4. ICH –</u>

In uniting regulatory authorities and the pharmaceutical industry, the The International Council for Harmonisation (ICH) is exceptional in addressing scientific and technological issues of pharmaceuticals and establishing ICH recommendations. ICH has steadily grown since its establishment in 1990, as it has tackled increasingly global trends in the pharmaceutical industry and a growing range of regulatories have implemented these ICH recommendations. ICH's goal is to insure that worldwide harmonization ensures the production, registration and management of secure, effective and good-quality medicines in the most resource-efficient way, in accordance with high standards. (Levenson et al.)

ICH has expanded as an organisation, with 16 Leaders and 32 members, following the declaration of the operational reforms in October 2015.

#### 4.1 ICH Quality Guidelines for biologics (Levenson et al.) -

These include

- Q5A(R1): (Evaluation of biotechnology products for viral safety, which are derived from human or animal cell lines) The purpose of this study is to determine the viral safeness of biotechnology products extracted from labeled human or animal-based cell lines and outline data to be submitted for marketing applications / registration. This guidance intends to include an overall structure for virus detection and viral clearance evaluation studies.
- Q5B: (Analysis of the expression construct in cells used for production of r-DNA derived protein products) It aims to explain details that is considered useful when analyzing the expression structure of protein derived from recombinant DNA.
- 3. Q5C: (Quality of biotechnological products, stability testing of biotechnological/biological products) The document enhances the recommendations for stability (Q1A) and also discusses particular details of stabilization test procedures that will take into consideration the unique properties of drugs in which proteins and/or polypeptides are present as the active components.
- 4. Q5D: (Characterization and derivation of cell substances intended for manufacturing of biotechnological/biological). This provides wider guidelines

for the growth and the processing of biotechnological / biological goods and for the preparation and characterization of human and animal cell lines as well as microbial cell lines.

5. Q5E: (Comparability evaluation of biologics in which changes regarding manufacturing process are made) The aim of this guideline is to develop guidelines for evaluating the comparability of biotechnological / biological goods prior and post improvements have been prepared in drug content or drug product manufacturing processes.

ICH Safety Guidelines for biologics (Levenson et al.) -

 S6(R1): (Preclinical safety evaluation of biotechnology-derived pharmaceuticals) This covers the preclinical safety testing requirements for biotechnological products. It addresses the use of animal models of disease, determination of when genotoxicity assays and carcinogenicity studies should be performed and the impact of antibody formation on duration of toxicology studies.

| Serial | Parameter  | India               | USA               | Europe             |

<u>6.</u> <u>Case study -</u> Regulatory withdrawal from market due to uncertain benefits:

Bevacizumab

## 6.1 Introduction -

- In the United States of America, FDA has implemented an accelerated medication approval plan, which tends to be of help to severe or life-threatening illnesses without appropriate care.
- This system provides drugs with a provisional approval dependent on clinical study results, which does suggest efficacy but which is not necessary for full approval. The full clearance depends on corresponding scientific confirmatory studies.
- Few nations, such as Australia, Canada, Italy and UK, have programs of public health insuring that have adopted specific 'proof coverages' schemes for the usage of licensed prescription drugs before sufficient testing results are provided at a later point.
- These new programs were appealing for policy makers as it temporarily resolves the issue of (a) conserving efficacy, safety, and cost effectiveness and (b) suffice industry and public expectation for admission.
- Though, doctors and healthcare professionals and legislative and support authorities ought to brace themselves for such a scenario not fully known to withhold conditionally licensed medications.
- For purposes of unknown efficacy after provisional approval several reports of removal of drugs have been identified. In 2011, the FDA reported its intention to revoke the FDA's accelerated approval plan for bevacizumab, (Avastin), which was used for breast cancer treatment. (Vitry et al.)

# 6.2 Methods –

- A research structure based on three key themes for data analysis has been developed.
- Rationalization of FDA decision for clearance to combat advanced breast cancer and removal of bevacizumab.
- (2) Stakeholder's participation and responses to decisions.
- (3) Suggestions for future risk administration plans.

• Government documents and scientific reports were primarily used to monitor bevacizumab regulatory history.

## 6.3 Results -

- Bevacizumab is a humanized recombinant monoclonal antibody to vascular endothelial growth factor (VEGF) by Genentech as Avastin; it inhibits the binding of VEGF to surface of endothelial cells, thereby decreasing the vascularization of cancerous tumours and stops their growth.
- FDA first approved Bevacizumab in 2004 for treatment of metastatic colorectal cancer, after which it found its application in other diseases like renal cell carcinoma and small cell lung cancer.
- In the year 2008 for the 1<sup>st</sup> time bevacizumab was permitted as first line treatment of metastatic breast cancer under FDA's accelerated approval program. The approval was based on study published in NEJM (New England Journal of Medicine).
- This trail showed a progress in survival rate of women affected by advanced breast cancer when treated with bevacizumab and paclitaxel together.
- Results of NEJM were used by Genentech to endorse drug to physicians and also claimed that at that point 9000 patients were cured with 'off label' bevacizumab.
- The official review conducted by ODAC for bevacizumab in metastatic breast cancer was less positive than the NEJM paper. It highlighted several methodological shortcomings of the NEJM trial, including the use of progression-free survival as an endpoint and the lack of blinding. Progression-free survival has not been shown convincingly to be an appropriate surrogate endpoint for breast cancer or to be predictive of overall survival
- The FDA therefore required an autonomous, unbiased assessment of radiological and clinical data of all patients in the E2100 trial. Although this confirmed that the addition of bevacizumab to paclitaxel resulted in a statistically significant improvement in progression-free survival, he estimate of the magnitude of the effect lacked reliability because of incomplete data.
- Failure in follow-ups and incoherence of radiologic illness development (34 percent of patients). The ODAC has reported major safety problems with

bevacizumab, like a 20.2% rise in toxicity (like hypertension, gastrointestinal perforation, sensory neuropathy, hemorrhage, thromboembolism) & a 1.7 percent rise in drug-related mortality in bevacizumab plus paclitaxel study in comparison with 0 percent for paclitaxel alone study.

- On the basis of proof, ODAC voted 5 to 4 in open voting not to approve acceptance of the data presented to decide if a favorable risk / benefit scenario for the use of bevacizumab + paclitaxel as the first line for metastatic breast cancer therapy is appropriate.
- Regardless of what ODAC decided, the FDA approved bevacizumab based on supplementary studies in February 2008.
- As a result of this announcement, stocks of the drug producer increased more than 8% after trading hours. However health providers and organisations including the Regional Breast Cancer Coalitative Fund have reduced the FDA requirement for therapeutic certification.
- The ODAC has reassessed clearance and reviewed the outcomes of two more clinical studies in July 2010, and has voted 12-1 to approve the elimination of the metastatic breast cancer bevacizumab label.
- The two recent findings found little change in total survival and fewer progression-free gains than in the initial NEJM report. None of the findings have shown enhanced living conditions and all display an elevated likelihood of serious harmful consequences, such as gastrointestinal perforation and extreme bleeding. In both the bevacizumab and control categories, the total number of treatment-related fatalities (1.8%) was similar.
- In December 2010, the FDA declared its plan to revoke the recommendation that at the moment, 17,000 female patients with advanced breast cancer had bevacizumab, and financial analysts predicted that revoking FDA breast cancer clearance would cost Genentech 1 billion US dollars in revenue, based on before expected estimates. Genentech demanded an administrative trial in an alternative case.
- In June 2011, the two-day hearing required the oral testimony of ODAC consultants, Genentech-designated consultants and representatives of the public. There were also encouraged to comment online or in writing on the request from the FDA to withhold permission.

- During the hearing time FDA obtained 450 public requests, many from customers, urging the FDA to uphold their belief as the medication was effective for themselves or close friends or relatives..
- The FDA recommended bevacizumab for certain user categories. Survivors provided bevacizumab their safety and existing life satisfaction and named themselves 'super-respondents.' No public statement was made on whether respondents could be separated from non-respondents in advance or whether respondents could be a minority of women. It was accepted that no means for the estimation like biological marker for bevacizumab's efficacy in clinical trials had been identified in subsequent empirical discussions of the ODAC..
- Members of the general public never expressed questions regarding bevacizumab's health during the trial, and the negative consequences of bevacizumab were generally minor or manageable. A woman from SHARE members, a group of survivors of cancer said 'there are other people we know with every woman we attest to here, a fellow of our community who bled out of every orifice and another woman that has a brain hemorrhage. And those women are not coming to bear witness.
- The National Breast Cancer Coalition's vice president and breast cancelation survivor Christine Brunswick, who said: This judgment can not be motivated by facts, was among the few who endorsed removal of bevacizumab. Technology needs to push it. At the conclusion of the meeting, ODAC voted 6–0 to withdraw the drug and in November 2011, the FDA eventually revoked its permission, after 3.5 years original conditional permission.
- FDA removal led doctors, public advocates, community providers, community decision leaders and the pharmaceutical sector to react and other doctors became very angry when one woman accused an FDA Committee of 'killing seventeen thousand women by one vote'.
- In scientific papers, the FDA withdrawal was extensively debated. The FDA was supported by a Clinical Oncology in an editorial, which reported that "The results were definitely not scientifically necessary." An oncologist who was an ODAC participant of the FDA meeting, contemplating the decision to withdraw, announced, "we do not want any medications that do not perform too well to damage citizens. We will not bring false optimism.

- By comparison, the FDAs have been refusing American access to life-saving medications through Dr. Milton Wolf, a radiologist who published a conservatory article on the Washington Times, called 'the FDA's one-man death council,' explaining the complexity and uncertainty of the FDA's procedures as "regulatory obstacles" to creative medication delivery in the United States.
- In a research carried out following the suggestion of the ODAC to revoke the sanction of bevacizumab, decisions and views of healthcare professionals on the FDA retiring decision were considered. 564 researchers from all over the country, most of them practicing oncologists, were included in the study. A limited number of citizens (52 per cent) complied with the decision by the FDA to revoke the recommendation because the results of the two additional bevacizumab trials in the original E2100 report were not the same but 48 per cent felt that this was not a compelling explanation.
- In 122 oncology procedures affecting 570 US oncologists, a further analysis explored patterns in the application of bevacizumab for breast cancer. The study concluded that usage decreased by 37% between May 2010 (only before the revoking acceptance meeting of the ODAC) and November 2010 (only before the withdrawal procedure begun), and by 63% just before the FDA's formal retraction warning, without corresponding revisions to therapeutic recommendations or insurance scheme that may justify these patterns. (Vitry et al.)

## 6.4 Discussion –

- The possible social and human effects of withdrawal decisions must be understood and prospectively handled by regulatory agencies & financial institutions as the conditional approval system or procurement of pharmaceutical drugs pursuant to the availability of sufficient proof is expected to broaden in the future.
- The popular response to the case may have been high because the media awareness of breast cancer and bevacizumab was previously used for other cancers. Nonetheless, the public awareness and acceptation of permissions

and reporting schemes are definitely improved based on the production of facts.

- Robust risk reduction strategies that provide the possibility for the withdrawal of the conditionally authorized signal must be established and enforced by regulators.
- At the outset of this study, there were variations in the understanding of the data as to its relevance, its therapeutic value and the comparatively small weight of the possible benefits and harms of bevacizumab.
- Regulatory policies are intended to safeguard public wellbeing and promote social protection, which can clash on certain instances with the desires of particular patients.
- Many experts raised concerns such as 'that distressed patients might divert focus from the interest of current or potential patients and the business'.
- However, members of certain cancer patients have claimed 'a month may be the correspondent of one year if the life span is reduced,' indicating that this controversy is not readily settled.
- Clearly people who prefer bevacizumab are more commonly and clearly taken into consideration who did not. For this, there have been many explanations. Survivors also link their longevity to their recovery and speak out to endorse their continued availability.
- It is clear that patients that perform less good and may not recover (and who may have experienced more harm) can not bear witness.
- The efficacy of cancer therapies generally has been overestimated by doctors. A study of advanced colorectal and lung cancer patients (metastatic) in the U.S. showed that the majority of (81% of colorectal cancer patients & 69% of lung cancer patient) did not realize that chemotherapy does not cure their cancers.
- First of all, there should be views of an early warning warning indication of possible concern where a prospective clearance or regulation is expected to be restored after the original recommendation from ODAC and the determination for clearance of the FDA. Regulators will start investigating and suggest including these arguments in education, health practitioners and media relations research whether the votes are divided

for acceptance. Risk reduction preparation may improve awareness of clinical ambiguity in the practice of the medication licensed at the time of initial authorization or treatment decisions.

- A broad variety of records, including full transcripts of the proceedings, is accessible on the FDA Web site both at the period of acceptance and the removal. The FDA records, however, can be lengthy and challenging to read, making it difficult for lay publics and health professionals to obtain details.
- Secondly, better health instruction on the efficacy and protection of the latest drugs must be given, more reasonable standards of patients and caregivers must be created, especially where there are substantial uncertainty as regards the effectiveness of medical technology. Medicines sold and approved through provisional authorisation or funding may still need somewhere to alert or remember the minimal facts and tentative character of acceptance to health staff as well as patients, possibly in line with alerts in the black box and black triangles, which were introduced to reassure the public.
- Third, medical support is a requirement for subsidization in many countries for continuing treatment focused on improved safety. Similar approaches can be implemented for reciprocal coverage systems, in which patients may be expected to accept that there is ambiguity regarding effectiveness and protection at the onset of care and acknowledge that ongoing treatment may rely on proof of efficacy or protection subsequently.
- In addition, it was considered fair to allow patients who receive uncertainbenefit medical treatments to submit their data to ongoing assessment, as part of the evidence creation support initiatives, these systems are now being implemented. (Vitry et al.)

#### 6.5 Conclusion –

• The public will not be entirely reassured by the revocation of conditional therapeutic acceptance because of unpredictable consequences, for several

reasons, including the dynamic science assessment and growth of irrealistic expectations fueled by news and the pharmaceutical industries.

• For the implementation of risk reduction programs, legislative and financing authorities may find the suggested approaches. The packaging and labels of medications and clear patient recognition of the importance and danger of contractual consent require centered, recognizable and lasting contact with the public and media.

## <u>7. Summary –</u>

- Biologics are drugs that are produced by living organism or contain a component of a living organism.
- Biologics have been a part of the treatment regime for a lot of disease like rheumatoid arthritis, Chron's disease and with growing rate of cancer they find their application even more as monoclonal antibodies and gene therapies.
- Regulatory bodies are made to keep a check on products entering the market and also benefit pharmaceutical companies.
- There are different regulatory bodies in different countries like USFDA in US, EMA in Europe and DCGI in India. Each regulatory has different guidelines for different pharmaceutical product.
- Regulatory compliance helps (1) eliminate risk by identifying, mitigating and eliminating risk at all stages, (2) enhance customer and investor confidence and (3) saves costs (4) ensure production and approval of drugs showing optimal efficacy, safe and non toxic.
- Regulatory compliance also helps speed up the process of marketing authorization.
- This project has helped me understand how guidelines differ from country to country and how its compliance is beneficial for industries.

## 8. Conclusion –

- This project not just allowed me to learn about what are guidelines but also their importance and their application in industrial practice and also how regulatory works for harmonization of two different schools of thoughts. (1) ensuring public health, (2) helping industry make more efficient and safe drugs and (3) facilitate import and export of drugs.
- The case study shows us how a law made to facilitate drug discovery and applicability but without enough consideration can chaos within the medical environment of the country and hence the regulatory system should be sound enough with all its aspects before passing any new rule.
